Conservation laws

- Momentum:

$$\rho \left(\frac{\partial \mathbf{v}}{\partial t} + \mathbf{v} \cdot \nabla \mathbf{v} \right) = -\nabla p + \nabla \cdot \boldsymbol{\tau} + \mathbf{F}$$

- Mass:

$$\frac{\partial \rho}{\partial t} + \nabla \cdot (\rho \mathbf{v}) = 0$$

- Energy:

$$\rho \frac{dh}{dt} = \frac{dp}{dt} + \nabla \cdot (k \nabla T) + \Phi$$

Relationship between the material properties

- Ideal gas law:

$$p = \rho R T$$

A fundamental problem in analysis is to decide whether such smooth, physically reasonable solutions exist for the Navier–Stokes equations, thus the Clay mathematical institute posts 1 million dollar reward among the seven most important mathematical problems of the millennium. These are:

- Yang–Mills and Mass Gap
- Riemann Hypothesis
- P vs NP Problem
- Navier–Stokes Equation
- Hodge Conjecture
- Poincaré Conjecture (solved by Grigoriy Perelman, 2003)
- Birch and Swinnerton-Dyer Conjecture

Numerical solution of the N–S equations

Numerical
methods

Analysis

Simple
problems

Scripting

- While the analytical solution of the N–S equation are not known
 - Spatial discretization (mesh: grid or cell network)
 - Boundary conditions (at the bounding surfaces)
 - Temporal discretization (suitable time step, Δt)
 - Initial conditions (at $t = 0$)
- Simplification of geometry
- Simplifications of equations
 - Suitable coordinate system (Cartesian, cylindrical, spherical)
 - Steady vs. unsteady
 - Compressible vs. incompressible
 - Laminar vs. turbulent
 - External forces (gravitational, Coriolis, centripetal)

Numerical solution of the N–S equations

Simple

Numerical
methods

Analysis

Simple
problems

Scripting

- Spatial discretization
 - Finite Volume Method (FVM)
 - Finite Element Method (FEM)
 - Finite Difference Method (FDM)
 - Spectral methods (e.g. for DNS on periodic domains)
 - Lattice gas model, lattice-Boltzmann method
- Temporal discretization (unsteady problems)
 - Explicit and implicit schemes, stability criteria (e.g. CFL)
 - Local time-step, adaptive time-step control
- Pressure-velocity coupling
 - Pressure correction (sequential, e.g. SIMPLE, PISO)
 - Coupled: simultaneous solution of the equations

Finite Volume Method (FVM)

Simple problems

Balogh Miklós

Review on theory

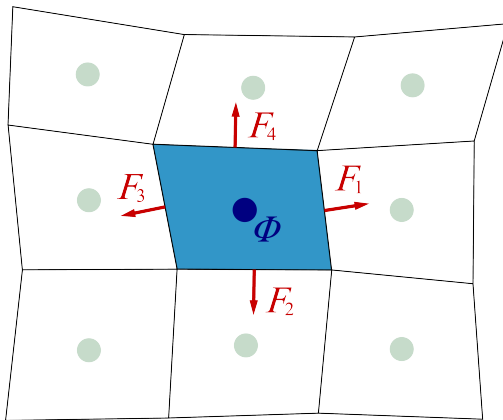

Numerical methods

Analysis

Simple problems

Scripting

- Arbitrary cells (volumes)
- Conservation laws are applied on these in integral form

Finite Volume Method (FVM)

Numerical
methods

Analysis

Simple
problems

Scripting

- General form of the conservation laws:

$$\frac{\partial}{\partial t} \int_V \rho \phi dV + \oint_A F d\vec{A} = \int_V S_V dV + \oint_A S_A d\vec{A}$$

- Where ϕ and F respectively
 - The conservative quality per unit mass:

$$\phi = U/\rho$$

- The sum of convective and conductive fluxes:

$$F = F_{konv.} + F_{kond.} = \rho \phi \vec{v} - \rho \nabla \phi$$

Steps of the numerical analysis

Simple
problems

Balogh

Review on
theory

Numerical
methods

Analysis

Simple
problems

Scripting

- Construction of the geometry (computational domain)
- Mesh generation
 - The basis of the spatial discretization
 - Decomposition of the domain to cells
- Definition of the boundary conditions
- Definition of the initial conditions
 - Constant - predefined values
 - Hybrid - potential flow solver
 - Patch - values given cell by cell (e.g. theoretical values)
- Simulation (integration of the equations)
- Post-processing

Numerical
methods

Analysis

Simple
problems

Scripting

- One can initialize a simulation with former results
 - obtained even on lower resolution,
 - via interpolating the fields to the new mesh

```
cd $FOAM_RUN/tutorials/incompressible
cd icoFoam/cavity
blockMesh > blockMesh.log
icoFoam > icoFoam.log
cd ../cavityGrade
blockMesh > blockMesh.log
mapFields ../cavity -consistent
icoFoam > icoFoam.log
```
